18 steps: 3.2957483385709168 over 10 experiments  
24 steps: 5.689855880353027 over 10 experiments  
30 steps: 6.449546831385447 over 10 experiments

1 steps: 1.0 over 10 experiments  
6 steps: 2.3729473667624426 over 10 experiments  
12 steps: 2.3880904506440808 over 10 experiments

18 steps: 3.121630664812957 over 10 experiments  
 24 steps: 4.260504238879372 over 10 experiments  
 30 steps: 3.909576880528656 over 10 experiments

Below graph denotes the steps and distance deduced from random walk experiment.

The expected distance for a random walk in a 2D plane is given by the square root of the number of steps multiplied by the step length. The resulting distances are plotted against the number of steps showing how the Euclidean distance tends to increase with the square root of the number of steps.

**Relationship Conclusion:** The relationship between the number of steps ( $m$ ) and the Euclidean distance ( $d$ ) in a random walk experiment, where each step is of length 1 meter and the direction is randomly chosen from North, South, East, or West, can be described by the formula:

$$\sqrt{m} = d$$

This relationship is based on the properties of random walks, and the Euclidean distance - grows proportional to the square root of the number of steps.

**Evidence to support that conclusion:**

Y-axis	X-axis
M	d
1	1
6	1.95
12	3.36
18	3.07
24	4.72
30	3.7

After analyzing above relation, we can come on equation  $m = (x_2 - x_1)^2$  which calculates as:

m - 1  
m - 4.07  
m - 10.5  
m - 14.09  
m - 18.44  
m - 24.3

Further solving we conclude that,

$m - (x_2 - x_1)^2 = 0$   
 $m - \Delta d^2 = 0$   
 $m = d^2$

$\sqrt{m} = d$

Hence as per graph plotted, we can now tell how the Euclidean distance tends to increase with the square root of the number of steps.
